Pretty-print

{"products":[{"id":16,"name":"1080p Webcam","description":"Full HD webcam with privacy cover and built-in microphone.","category":"Video","emoji":"📷","price":1450,"stock":0,"active":true,"createdAt":"2026-09-10T12:15:26.916Z","updatedAt":"2026-10-08T09:22:38.376Z"}]}

Explanation:

When a shopper types, the frontend updates its search state and sends a `GET /api/products` request with the search term to the backend. The server then uses Prisma and PostgreSQL to fetch active products whose name or description case-insensitively matches the term, returning an empty array if nothing matches. On the client side, the effect resets loading and error states and uses a cleanup flag to ignore outdated responses from rapid typing so old results never overwrite newer ones. Finally, the page applies the user's selected category and sort settings to the returned results while preserving the full list of category options from a separate initial load.
